

Impact of deep water formation on particle distribution – Case cruise DEWEX and MOOSE.

Ramondenc S., L. Guidi, L. Coppola, L. Stemman, F. Lombard, X. Durrieu de Madron.

The ocean-atmosphere coupling is responsible for deep water formation in the northwestern Mediterranean Sea through two physical processes : open sea convection and dense shelf water cascading. This study shows the influence of these physical processes on particles distribution thanks to long-term intensive monitoring (MOOSE) and winter cruise (DEWEX-leg1).
